#### Anesthetic Procedures and Risks

We use a combination of injectable and inhalant anesthetics to achieve optimum levels of anesthesia that are safe for your pet.

For most procedures, your pet is anesthetized and then intubated. This will ensure that your pet is able to receive oxygen at all times and prevents aspiration of any fluids into the lungs. For short procedures, an injectable anesthetic is given alone that produces a good plane of surgical anesthesia with a quick recovery.

Our clinic strongly believes in compassionate, quality, medical care for our patients. As a result, all surgery patients will receive pain management before, during and after surgery. Additionally, pain medication may be prescribed for use at home. Additional information will be given at discharge. We hope this program will reduce any discomfort experienced and aid in a quicker recovery.

Our clinic puts your pet's health and well being first, but with any surgical procedure there are potential risks and complications. Some of them are but not limited to bleeding, infection, suture reaction, swelling, and death. We strive to take the highest quality care of your pet and take all the added precautions you allow to avoid potential problems. If you have any questions or concerns please feel free to discuss them with our Veterinarian or staff.

We also highly recommend and sometimes require that a **Pre-Anesthetic Blood Profile** (CBC and Chemistry) be performed on all pets undergoing anesthesia to maximize patient safety. The **Pre-Anesthetic Blood Profile** helps alert our surgeon to the presence of dehydration, anemia, infection, diabetes and/or kidney or liver disease that could complicate the procedure. These conditions may not be detected **without** a pre-anesthetic profile thus not allowing for the most appropriate and safest anesthetic regime to be administered. These tests are similar to those your own physician would run if you were to undergo anesthesia. In addition, these tests may be useful if your pet's health changes to develop faster, more accurate diagnoses and treatments.

**Would you like us to perform the Pre-Anesthetic Blood Profile on your pet? (\$75.00) Yes / No**

#### **Intravenous Catheterization & Fluids**

We highly recommend and sometimes require the placement of an IV catheter and use of IV fluids during all anesthetic procedures. This allows us to have quick, available access to the circulatory system (blood) in case of an unforeseen emergency. The fluids help provide support to the circulatory system and prevent dehydration, as well as aid in a quicker recovery from anesthesia.

**Would you like us to place an Intravenous Catheter for your pet's surgery? (\$35.00) Yes / No**

I give permission for the Veterinarian and, under her direction, the staff of St Francis Animal Hospital to **anesthetize** and **perform** the listed procedures on my pet. **I understand that if a complication arises every attempt will be made to contact me.** In the event of a life or death situation the necessary measures will be taken. I also understand that I will be responsible for all charges when my pet is discharged.
